(Lower Bounds & Convex conjugate)

1 Lower Bounds for a Non-smooth Function

In the lecture, we have seen the lower bounds for a smooth and convex function. In this exercise, we will show a similar lowerbound for a non-smooth function.

1. Consider the function $f : \mathbb{R}^d \rightarrow \mathbb{R}$ given by

$$f(\mathbf{x}) = \gamma \max_{1 \leq i \leq t} \{\mathbf{x}_i\} + \alpha \|\mathbf{x}\|^2.$$

Is the function f (strongly-)convex? If so, what is the sub-differential of the function (for the sub-gradient of the \max function in case of multiple max-valued co-ordinates choose the one with smallest index) ? Is f smooth?

2. For the function f defined in the previous question, for any gradient-based algorithm initialized at $\mathbf{x}_0 = 0$. Show that

$$\text{Span}\{\partial f(\mathbf{x}_0), \partial f(\mathbf{x}_1), \dots, \partial f(\mathbf{x}_{s-1})\} = \text{Span}\{e_1, e_2, \dots, e_s\}$$

where \mathbf{x}_s is the point after s iterations of the algorithm.

3. For any $R \geq 0$, consider the set $B(R) = \{\mathbf{x} \in \mathbb{R}^d : \|\mathbf{x}\|_2 \leq R\}$. Show that for any $\mathbf{x} \in B(R)$, f is Lipschitz.
4. For the point y defined by

$$y[i] = \begin{cases} -\frac{\gamma}{\alpha t} & \text{if } 0 \leq i \leq t \\ 0 & \text{otherwise.} \end{cases},$$

show that $0 \in \partial f(y)$.

5. Using the point y and the previous properties, show that for $R > 0$, there exists a L -Lipschitz function f , such that for iterates $\{x_i\}$'s given by a gradient-based algorithm initialized at $\mathbf{x}_0 = 0$, the following holds:

$$\min_{1 \leq s \leq t} f(x_s) - \min_{\|x\| \leq R} f(x) \geq \frac{RL}{2(\sqrt{t} + 1)},$$

for $s < t$.

Hint: Choose α and γ appropriately for R and the Lipschitz constant.

2 Convex Conjugate

For a function $f : \mathbb{R}^d \rightarrow \mathbb{R} \cup \{+\infty\}$ (which is not necessarily convex !), we consider its **convex conjugate** which for $y \in \mathbb{R}^d$ is defined as

$$f^*(y) = \sup_{x \in \mathbb{R}^d} (\langle x, y \rangle - f(x)) \in \mathbb{R} \cup \{+\infty\}$$

Prove the following properties.

1. Show that f^* is convex.

2. Show that for $x, y \in \mathbb{R}^d$, $f(x) + f^*(y) \geq \langle x, y \rangle$. This is known as Fenchel's inequality.
3. Show that the biconjugate f^{**} (the conjugate of the conjugate) is such that $f^{**} \leq f$.

The Fenchel-Moreau theorem (which we will not prove here) states that $f = f^{**}$ if and only if f is convex and closed. It will turn out to be useful to show the following property.

4. Assume that f is closed and convex. Then show that for any $x, y \in \mathbb{R}^d$,

$$\begin{aligned} y \in \partial f(x) &\Leftrightarrow x \in \partial f^*(y) \\ &\Leftrightarrow f(x) + f^*(y) = \langle x, y \rangle \end{aligned}$$
